River Leam Catchment in SIMCAT

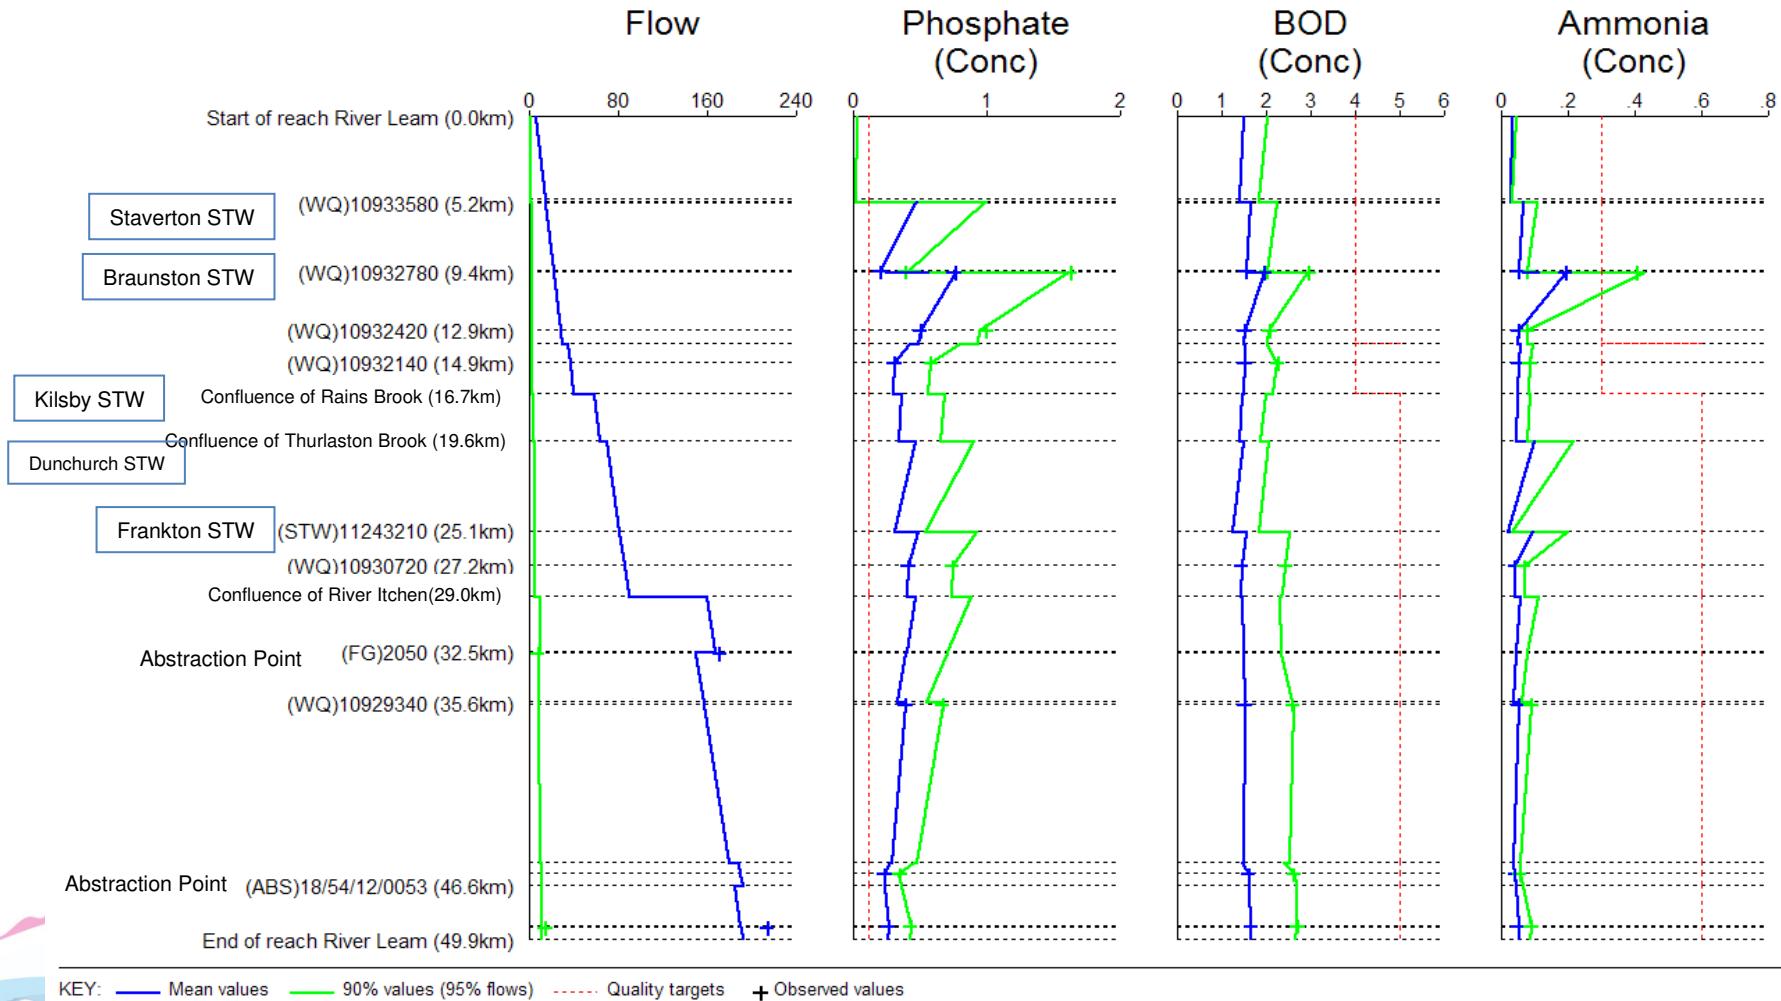

Waste Water Services

Current Flow and Quality Position

SIMCAT RESULTS
Date: 13/10/2011

SEVERN_ArcGIS Simcat Geodatabase V2

Initial SIMCAT modelling outputs

An initial SIMCAT simulation has been run to assess the likely river quality improvement delivered by addition of Phosphorus removal equipment to selected sewage treatment works:-

- Staverton STW
- Braunston STW
- Kilsby STW
- Dunchurch STW
- Frankton STW

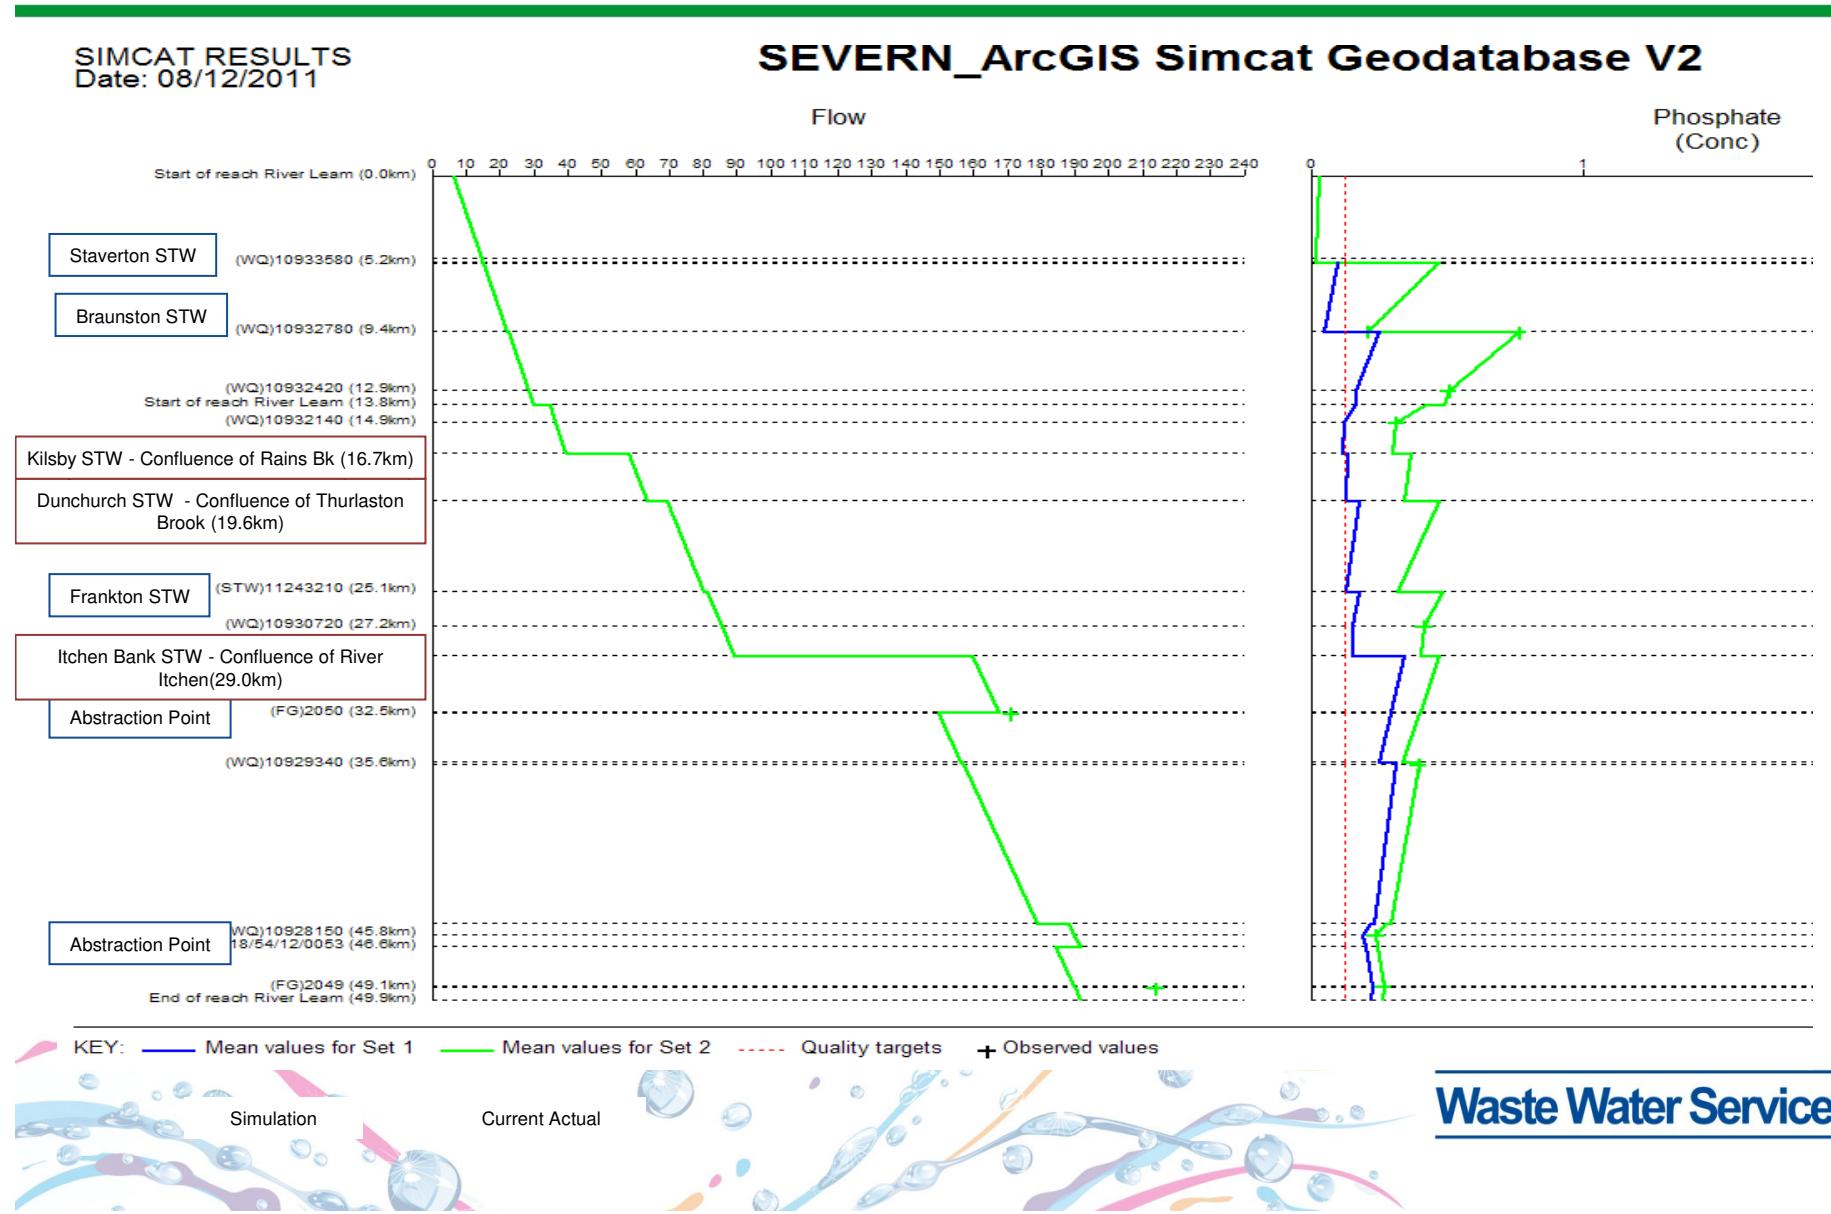

The model run is on the basis of imposition of 1mg/l total phosphorus consents

In practice, a works with a 1 mg/l total phosphorus consent will be operated to deliver an effluent that is some way within the consent limit.

The following plot does not reflect the likely improvements that will be delivered by the ongoing phosphorus removal project at Itchen Bank STW.

SIMCAT Output – Simulating impact of 1mg Phosphorus consents.

Key Points

- There are 16 Severn Trent Sewage Treatment Works in the River Leam catchment. However, only 9 are represented in the SIMCAT model.
- Of the 7 sewage works not included in SIMCAT, 4 are in the upper reaches of the river Itchen. One of these (Fenny Compton) is likely to be significant.
- There is one major quality improvement project taking place in AMP5 – the addition of Phosphorus removal equipment at Itchen Bank STW
- Phosphorus apportionment to sewage works in SIMCAT in the upper Leam reach is questionable and requires investigation.
- Severn Trent intend to work with the EA with a view to including a number of Phosphorus removal projects in our AMP6 business plan.
- Phosphorus removal at sewage treatment works alone will not deliver good status required by WFD.
