

“I think the overall theme will be the role of theories/notions of practice in innovation models/strategies.” Hans

A few notes in response from Elizabeth

TRANSITIONS IN PRACTICE **climate change and everyday life**

Transitions and end-user practices

“In this presentation I argue that social theories of practice are useful and important because they deflect attention away from the actions and responses of end-users and consumers. By taking practices as the central unit of analysis, new and different questions emerge that are relevant for understanding social change and sustainability.” Elizabeth

“In this session we will reflect upon the KSI research results aimed at investigating a better, context specific fit between greening strategies and consumer practices. In general, people underscore values of a more sustainable development. However, in practice, it proves to be rather difficult to change consumer behaviour. What is the problem here?”

How to give citizen-consumers a stronger role as change agents in multi-level transition processes? Involving end-users in transition processes will prove itself to be more of a socio-cultural than of a purely technological and/or economic nature.” Hans

Investigating a better,
context specific fit between
consumers and greening
strategies (Hans)

it proves to be rather difficult to change
consumer behavior.

How to give citizen-consumers a stronger role
as change agents in multi-level transition
processes?

Transitions and practices

Landscape developments

Socio-technical regimes

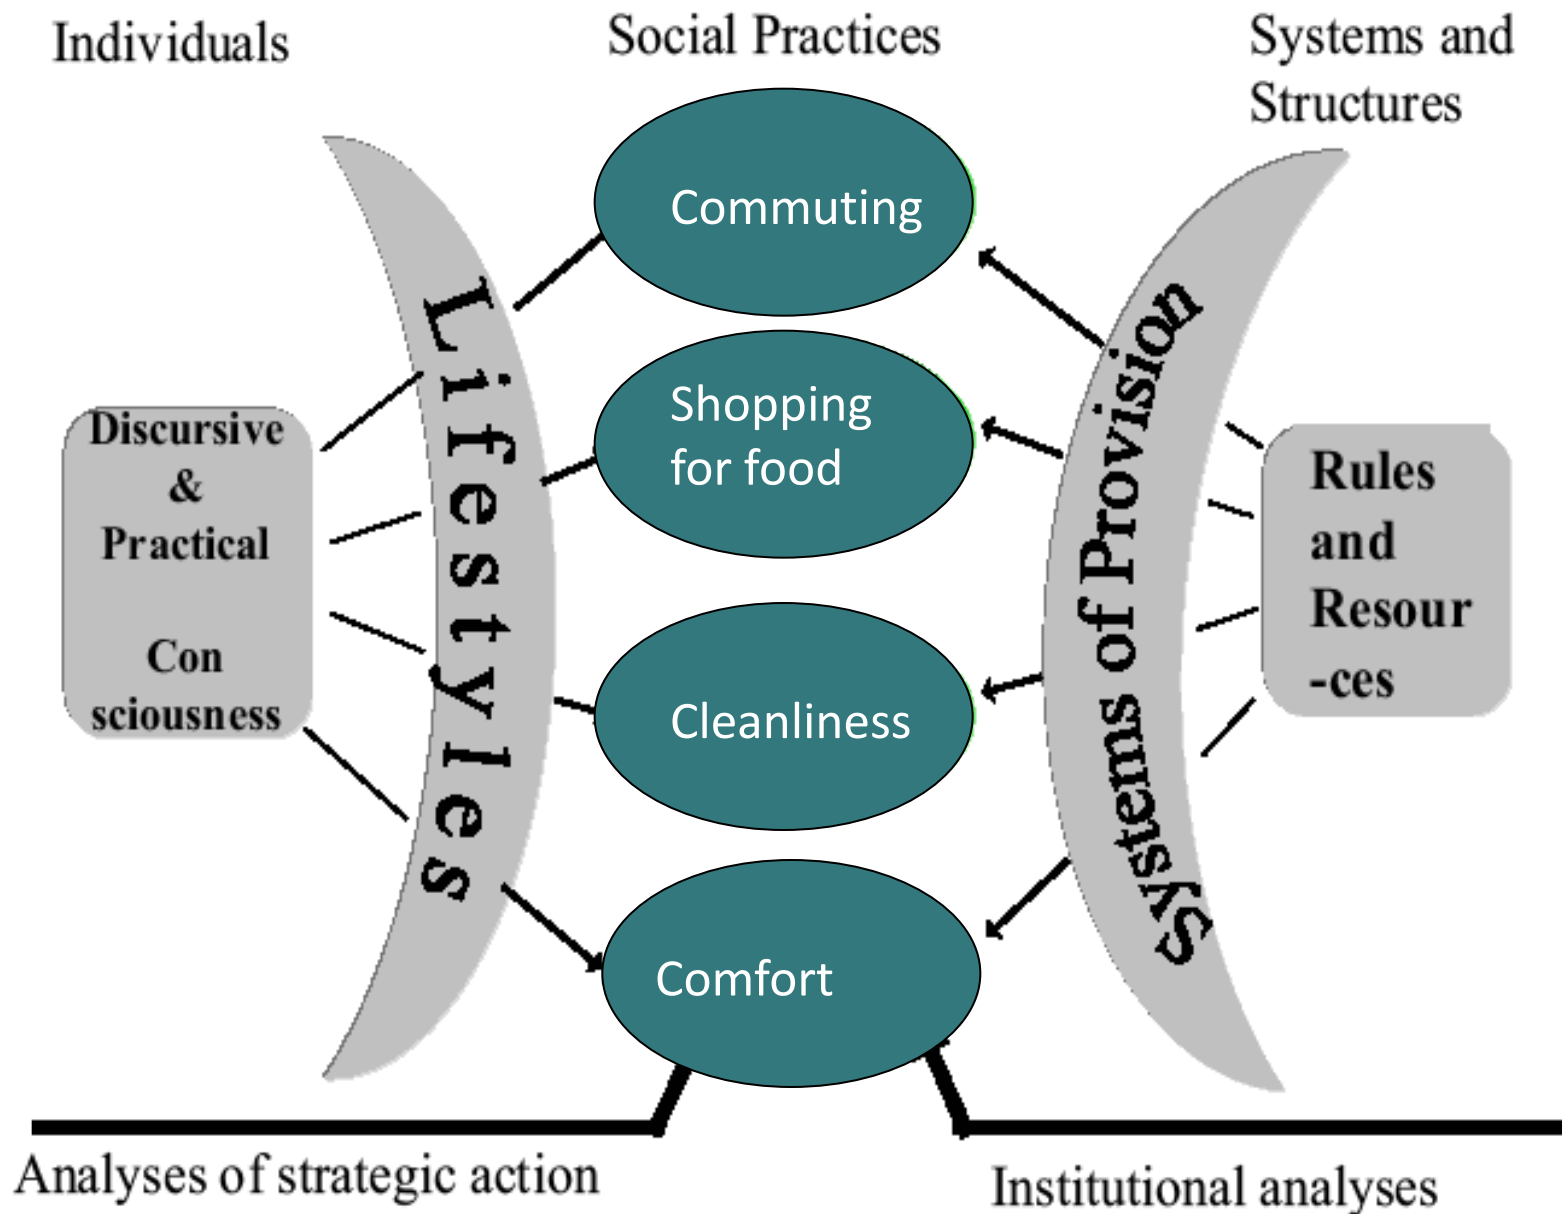

Technological niches

Time

Practices and transitions

A version of "Spaargaren's ears" : practices as outcomes; domains of behaviour; lifestyle choices not selection environments

Transitions and practices

Selectors (selection environment, close link to markets)
Facilitators and obstructors (of transition, link to failure)
Existing practices as context of change, habit, barrier (landscape?)
Media of change (knowledge is radically revised)

practices

Producer-promotors
Innovators, entrepreneurs

Not practices

Practices and transitions

How sociotechnical systems are used in daily life;
Lifestyle, not just market

pressure and motivation to change, spur to transition (citizen-consumer)

practices

Institutional, systems of provision, infrastructures

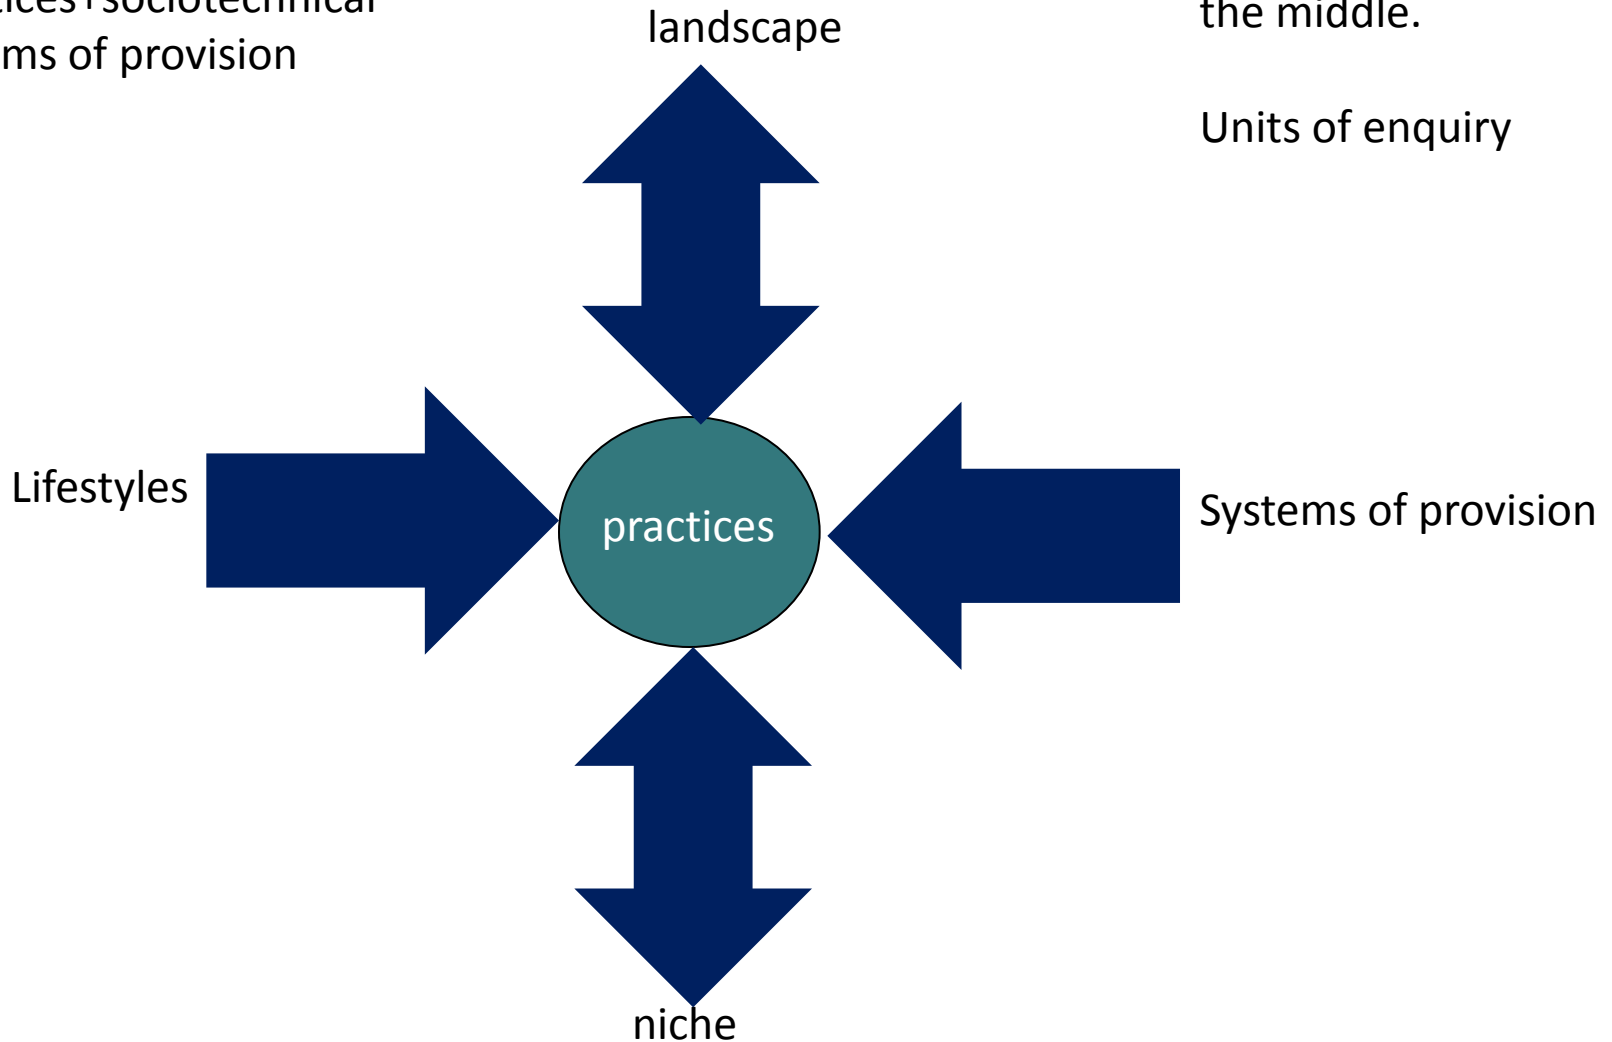

Implicitly agree:

Step change in the configuration of practices+sociotechnical systems of provision

Implicitly disagree:

Origins of change up, down, left or right, but not the middle.

Units of enquiry

Re-integrating resources from social theory

practice (Giddens)

Social sciences study “Neither the experience of the individual actor nor the existence of any form of social totality but **practices ordered across space and time**”

+

practice (Schatzki)

Practice as ‘embodied, materially mediated arrays, shared meanings’
(i.e. materials, images, skills)

=

a material (integrative) theory of practice

Image Material

Practice is a *process* of integration resulting in a structured arrangement - i.e. resulting in *a practice* that exists (for a time) as a recognisable *entity*.

Elements that are integrated consist of material, **image** and **skill**

Generates slightly - but significantly - new questions

- **How do practices emerge, exist and die?**
- **How do practices recruit constituent elements and activating practitioners?**
- **How do systems of practice form, exist and break down?**
- **How are elements of practice generated, renewed and reproduced?**

How do practices emerge, exist and die?

Making and breaking links between elements

proto-practices
(pre-formation)

practices
(re-formation)

ex-practices
(de-formation)

**Attend to the trajectories of image and competence as well as material
Desires/lifestyles and systems of provision are outcomes of practice**

How do practices recruit constituent elements and activating practitioners?

Recruitment and reproduction

Capture practitioners

Careers of carriers

Path and project

Careers of practice

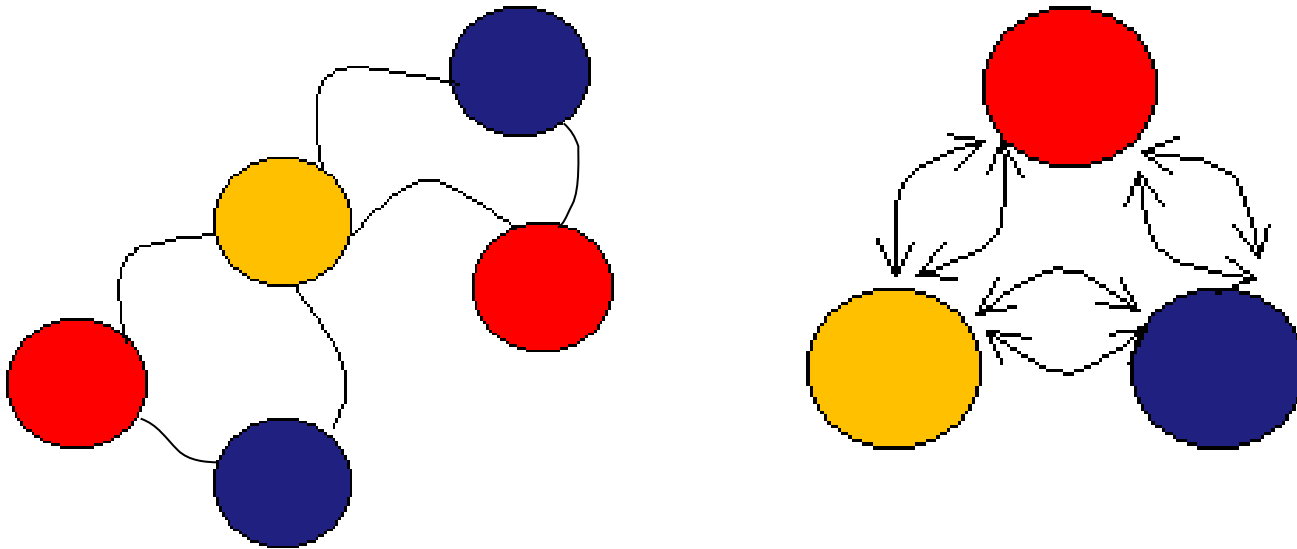

link between career of practice and anti-programme, recruitment, selection and fossilisation

Transitions in relations between practices (which win, which lose), not between technologies alone.

How are elements of practice generated, renewed and reproduced?

Elements are partly autonomous because they are created through multiple integrations (practices)

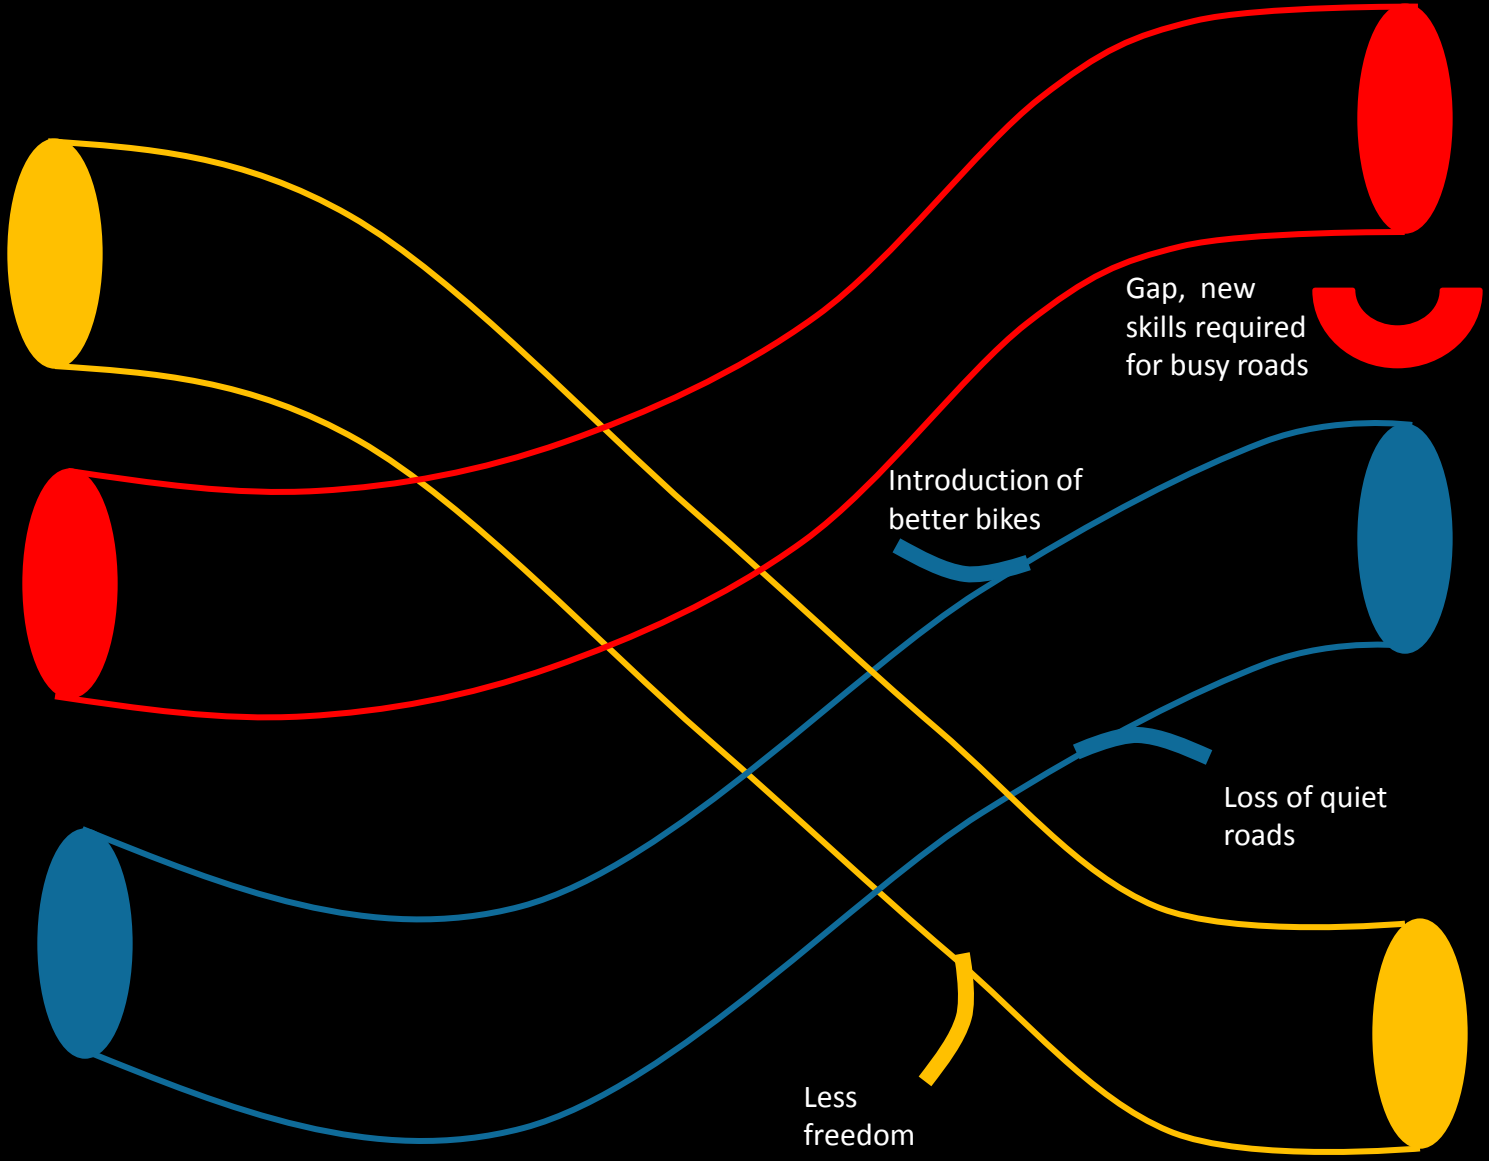

how different elements (stuff, image, skill) circulate; how different elements constitute each other

Elements on the move: how cycling went from mainstream to niche

1950s mainstream

1990s niche

Less freedom

Gap, new skills required for busy roads

Introduction of better bikes

Loss of quiet roads

In this presentation I argue that social theories of practice are useful and important because they deflect attention away from the actions and responses of end-users and consumers. By taking practices as the central unit of analysis, new and different questions emerge that are relevant for understanding social change and sustainability.

For example:

Commuting
by car

- Shared by many
- Significant and relatively recent change
- Resource intensive

Regularly
eating
meat

Can be understood in terms of: changing and new configurations of materials, images, skills; processes of recruitment and defection, relation between practices (time).

Daily
showering

Deliberate interventions: focus on elements, with consumers-users conceptualised as carriers of practice – not as primary agents of change, not as selecting the fate of technology.

Expecting 22
degrees C
indoors

Social practices consist of technologies (along with skills and materials) and are not external to them.

elements

other practices

landscape

Individual
Lifestyles

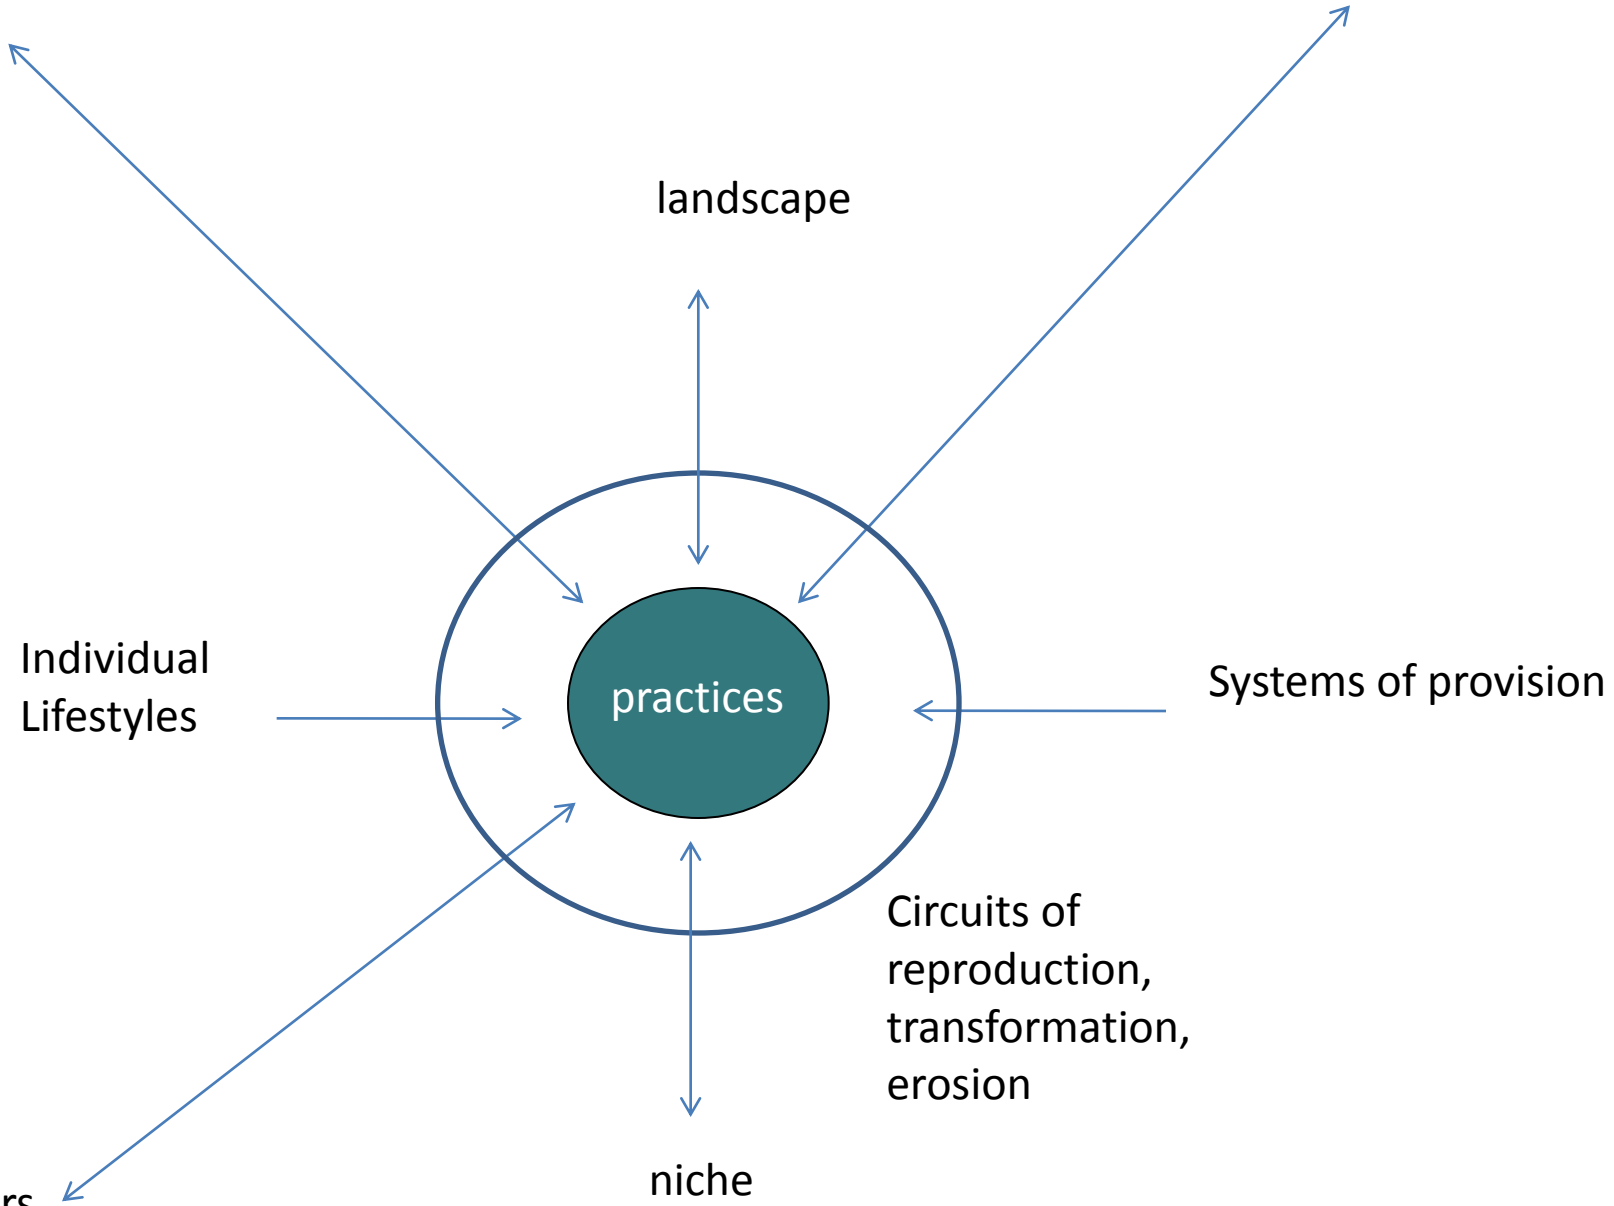

practices

Systems of provision

Circuits of
reproduction,
transformation,
erosion

carriers

niche

Individual attitudes, behaviour, choice
price and persuasion

Where most
effort is
focused

Changing forms of
everyday practice

Eating, heating,
cooling, washing

Where the
societal
challenges lie
